

From Manual Work to a Controlled Mentorship System

How YDP automated registration communication, participant identity, Gemini-assisted scoring, mentor matching, deployment, and audit controls.

What We Built and Why

Before

Manual acknowledgements, repeated checking, duplicate-email risk, and matching decisions spread across form answers and memory.

Now

Google Sheets is the operating surface. Apps Script handles repeatable work. Statuses, dates, IDs, and logs preserve the audit trail.

Principle

Automate repetition, keep decisions visible, and test one row before any bulk action.

Registration Flow

1. PREPARE

Setup email tracking columns

Creates the statuses and sent-at dates.

2. IDENTIFY

Assign IDs and mark duplicates

One stable ID per unique email.

3. AUTOMATE

Install form submit trigger

Future registrations run automatically.

4. TEST

Preview or selected send

Validate one row before scaling.

5. SCALE

Unsent-only bulk action

Rows already marked SENT are skipped.

Three Apps Script Projects

PROJECT	WHAT IT HANDLES	STATUS
Mentee registration	Acknowledgement emails, stable IDs, duplicates, triggers, status tracking, previews, selected sends, and resends.	Deployed
Mentor registration	The same safe control pattern in a separate mentor workbook and script project.	Deployed
Matching automation	Source snapshots, mentee scores, pair scores, recommendations, matched pairs, and match-notification emails.	Testing

SAY "The projects share one operating pattern but use separate script IDs and deployment folders. That separation is a safety control."

SHOW Open the repository root, then the **mentor** and **matching** folders. Show README and the workbook Data Dictionary tabs.

How the Matching Flow Works

1. SYNC

Source snapshots

Copy latest mentee and mentor applications.

2. SCORE

Mentee Scores

Gemini explains evidence; Apps Script applies fixed weights.

3. COMPARE

Pair Scores

Every eligible mentee is compared with every mentor.

4. SELECT

Auto-match

Highest score wins within mentor capacity.

5. NOTIFY

Matched Pairs

Preview one pair, send one pair, then bulk send.

Mentee scoring

40% learning commitment; 20% each for community, goals, and soft skills. Final score **60+** means Can Pair.

Pair scoring

40 skill fit; 30 career fit; 15 availability; 15 capacity. Total is out of 100.

20-30 Minute Demo Run Sheet

0-3 min	Frame the problem. Manual follow-up, duplicate risk, scattered decisions, limited visibility.
3-7 min	Show registration. Open mentee and mentor menus. Explain setup, IDs, triggers, preview, and SENT protection.
7-10 min	Show the repository. Explain three project folders, artifacts, architects, README, tests, and Git history.
10-14 min	Show matching setup. Source Config, snapshots, Mentee Scores, Pair Scores, Match Recommendations, Matched Pairs, Run Log.
14-18 min	Demonstrate scoring. Use Generate mentee scores batch or explain a saved completed row.
18-22 min	Demonstrate comparison. Explain Generate pair scores batch and the all-mentors comparison rule.
22-25 min	Explain assignment. Run Auto-match from pair scores only when comparisons are complete enough.
25-27 min	Show notifications. Use Preview selected match emails . Only use Send match emails to selected pair with approval.
27-30 min	Close. Explain Git/clasp, current status, leadership value, and next priorities.

Exact Matching Order

1. Sync source snapshots from the two form workbooks.
2. Test Gemini connection.
3. Finish mentee scores; completed rows are skipped and ERROR rows are retried.
4. Finish all required pair scores for each Can Pair mentee.
5. Run auto-match and review Match Recommendations plus Matched Pairs.
6. Preview one matched pair, send one selected pair, then use bulk sending only after the test.

GitHub and clasp

What each tool does

clasp sends local Apps Script files to the correct Google project.

Git records each verified change.

GitHub keeps the shared source and history.

```
# Mentee: repository root
clasp push --force

# Mentor
cd mentor
clasp push --force

# Matching
cd matching
clasp push --force

# Save verified work
git status --short
git add <files>
git commit -m "Describe change"
git push origin main
```

- DO** Edit the correct local file, run tests, push with clasp from the correct folder, commit, then push to GitHub.
- SAFETY** Each folder has its own **.clasp.json**. Running clasp from the wrong folder can update the wrong Apps Script project.

Safe Demo Rules

Do not expose

- Gemini API key values
- Participant phone numbers
- Private application answers
- Participant emails on a shared screen

Do not bulk send

- Preview first.
- Test one selected row.
- Confirm SENT statuses and dates.
- Bulk send only after approval.

If Something Goes Wrong

MESSAGE	MEANING	RESPONSE
503 UNAVAILABLE	The Gemini model is temporarily overloaded.	Wait and rerun. Completed work stays saved.
Quota reached	Configured keys cannot make another request now.	Wait for reset; resume later.
Needs More Pair Scores	Not every available mentor has been scored.	Continue pair scoring.
SENT, date blank	Tracking date is missing.	Repair the date; do not resend.
